

WebMCP AI Toolkit Pro (v3.0) — The Actionable Layer Guide

The WebMCP v3.0 plugin transforms your WordPress site from a **Visual Surface** (which AI struggles to read) into a **Structured Action Layer**. This documentation explains the new architecture and how to leverage it for the "Agentic Web."

1. Technical Architecture: The "Dual-Layer" Web

Version 3.0 implements the two core pillars of the Web Model Context Protocol (WebMCP):

A. The Declarative Layer (HTML Annotations)

The plugin automatically injects attributes (toolname, tooldescription) into your existing WordPress forms.

- **How it helps:** Instead of an AI agent using "Vision" to guess which box is for search, the browser identifies the form as a **Structured Tool**.
- **Efficiency:** Reduces token usage by up to **90%** compared to vision-based interaction.

B. The Imperative Layer (JavaScript API)

Using `navigator.modelContext`, the plugin registers deterministic JavaScript functions that AI agents can call directly.

- **How it helps:** It allows the agent to fetch post data via JSON rather than scraping your layout. It bypasses pop-ups, ads, and formatting noise.

2. How to Use the Plugin

Step 1: Deployment

1. Upload `webmcp-toolkit-pro.php` to your `/wp-content/plugins/` directory.
2. Activate the plugin in the WordPress Admin.
3. Go to the new **WebMCP AI** menu in your sidebar.

Step 2: Configuration

1. **System Status:** Toggle "Enable WebMCP" to start broadcasting your action layer.
2. **Declarative Forms:** Enable this to automatically "tag" your search and comment forms as tools.
3. **The Persona Engine:** Write a "System Instruction."
 - *Example:* "You are an assistant for a high-end furniture store. Always check product availability using the search tool before answering."

Step 3: The "Handshake" (Front-End)

On your website's front end, you will see a blue **WebMCP Bridge** button in the bottom left.

1. This allows users with **Local AI Agents** (running via `npx webmcp-bridge` or Claude Desktop) to link their browser tab to their local AI.
2. Paste the **One-Time Token** provided by the agent into the widget to secure the session.

3. Monitoring & Analytics

Navigate to **WebMCP AI > AI Analytics** to see the **Agentic Log**.

- **API Layer:** Shows if the AI used an "Imperative" (JS) or "Declarative" (HTML) tool.
- **Payload:** See exactly what the AI searched for or what data it tried to fetch.
- **Deterministic Success:** Monitor how the AI is interacting without "hallucinating" your site's navigation.

4. Impact on Search & SEO

While WebMCP is currently a browser-level protocol, it prepares your site for **Google's Search Generative Experience (SGE)**:

- **Better Crawl Efficiency:** Search bots can identify your site's "Actionable Tools" faster.
- **Rich Snippets:** By providing structured post details via the `get_post_details` tool, you ensure AI summaries of your content are 100% accurate.

5. Troubleshooting

- **Browser Support:** Currently requires **Chrome 145+** or **Chrome Canary** with the `#enable-experimental-web-platform-features` and `#webmcp` flags enabled.
- **Security:** This plugin does **not** allow AI to change your site settings. It only exposes tools that you (the admin) explicitly define.
- **Local Testing:** Use the **Bridge Widget** to simulate an agentic session if you are developing custom MCP tools.
