

WebMCP Addon for WP Recipe Maker

This addon extends the **WebMCP Pro** toolkit specifically for recipe-based websites. It allows AI agents to extract culinary data without getting distracted by ads, pop-ups, or social media buttons.

Integrated Tools

Once activated, your site exposes these specialized "Agentic Tools":

1. **get_recipe_data:**
 - **AI Use Case:** "What are the ingredients for this cake?" or "Give me the nutrition facts for this dinner."
 - **Benefit:** Returns a clean JSON object containing ingredients, steps, and nutrition.
2. **scale_recipe_servings:**
 - **AI Use Case:** "Adjust this recipe for 10 people."
 - **Benefit:** Provides the AI with the exact math needed to recalculate your recipe quantities instantly.

Recommended AI Persona (Recipe Site)

For a recipe website like openclawn.com, update your **WebMCP Persona** field in settings to: "You are a professional sous-chef AI assistant for OpenClawn. Your goal is to help users cook accurately."

Instructions:

1. If a user asks for a recipe, always call the `get_recipe_data` tool to ensure you have the correct ingredient measurements.
2. If a user wants to cook for a different number of people, call `scale_recipe_servings` to get the scaling factor.
3. Provide cooking instructions in a clear, step-by-step format.
4. Do not suggest substitutions unless the user asks for them."

Why this helps your SEO

Search engines like Google are prioritizing **SGE (Search Generative Experience)**. When Google's AI agent visits your recipe page, it will detect these WebMCP tools. This ensures your recipes are featured accurately in AI summaries, and users can interact with them (like scaling portions) directly within the AI browser interface.
